

iPhone / iPad L2TP Client Setup

This tutorial describes how to connect to your [AltCoinVPS](#) VPN Server using the built-in iOS L2TP/IPsec VPN Client. No extra apps necessary. All versions of iOS are configured similarly; however, there might be minor differences in UIs. Initial configurations are persistent. You only need to setup your VPN once.

From the iOS main screen, start the "Settings" application and open "VPN" tab in "General" section, and tap "Add VPN Configuration...".

A new L2TP VPN connection setting will be created, and the configuration screen will appear.

On this screen, you have to specify either hostname or IP address of the destination [AltCoinVPS VPN](#) Server. You also have to enter the user-name, password and secret (pre-shared key) on the iOS screen. Connect a VPN and check your IP. IT WORKS! Enjoy!
